

Innovative Design

The groundbreaking cleanliness of this vehicle can be attributed to two key design elements: the active particulate collectors and the efficient fully-electric drivetrain. The diagram above shows the front passenger-side wheel arch. The built-in particulate collectors combine suction and electrostatically-charged plates to capture approximately 90% of dangerous particles directly from the source. The deposit trays each have a volume of 1 Litre and are easily removed through ports on each side of the vehicle for emptying.
